Category: Forensics

Author: abdon.

Difficulty: easy

Step 1 — Discord cache forensics

The investigation begins in the target user's profile at C:\Users\Max. Moving into AppData\Roaming, the player finds a **Discord** folder. Recovering evidence from it requires some knowledge of Discord forensics. Navigate to the cache directory:

C:\Users\Max\AppData\Roaming\Discord\Cache\Cache_Data

Open this folder with **ChromeCacheView.exe** to enumerate the cached entries.

```
{
  "type": 0,
  "content": "\u2026you used ttorrent to steal corp data??",
  "mentions": [
  ],
  "mention_roles": [
  ],
  "attachments": [
  ],
  "embeds": [
  ],
}
```

To isolate the actual chat messages from the noise, filter the cache entries on the URL pattern: **1/0/https://discordapp.com/api/v9/channels/***

Discord fetches channel messages from the /api/v9/channels/ endpoint, so filtering on this pattern narrows the cache down to just the message-bearing API responses. This leaves **four relevant cache entries**.

```
{
  "type": 0,
  "content": "torrents",
  "mentions": [
  ],
  "mention_roles": [
  ],
}
```

Reading those four entries reveals a conversation in which the attacker explains exactly what they did on the host — this is the thread the player pulls for the rest of the challenge.

Step 2 — uTorrent artifacts and the archive

The Discord conversation directs the investigation toward the attacker's BitTorrent activity. The player should inspect the uTorrent data directory: **%AppData%\Roaming\uTorrent**

This directory holds some .torrent files the attacker had on the system but the one he should focus on is **important files.torrent**. The player can open any of these in the BitTorrent client of their choice and download the associated content.

Once the download completes, the player discovers that the resulting archive is **password-protected** — so the file alone is not enough. The password must be recovered separately, which is what the next stage is for.

Step 3 — Telegram: recovering the password

Returning to the Discord conversation, the player finds a clue that pivots the hunt to

Telegram. Investigating the attacker's

```
"content": "people send the word \u201cgime\u201d to @helper123_app_bot and it returns the password",  
"mentions": [
```

Telegram trail leads to a bot that
vends the archive password.

```
"type": 0,  
"content": "encrypted the archive using my telegram bot",  
"mentions": [
```

The Telegram bot **@helper123_app_bot** only responds to one exact message:

“gime”

Upon receiving exactly gime, the bot replies with the **password** required to unlock the archive.

With the password from the Telegram bot, the player extracts the archive. Inside they find the directory: “important files\Projects\media” folder the player will find 3 photos one of them containing the flag.

Flag:

L3AK{For3nsics_hUm4n\$_C4n_c00K_AI}

Solution summary:

1. Triage C:\Users\Max\AppData\Roaming and locate the Discord folder.
2. Parse Cache_Data with ChromeCacheView; filter on the channels/* URL to recover the attacker chat.
3. Follow the chat to %AppData%\Roaming\uTorrent; open a .torrent and download the password-protected archive.
4. Use the Discord clue to reach Telegram; message @helper123_app_bot with "gime" to get the password.
5. Extract the archive, open important files\Projects\media, and recover the flag from the correct image.
